

Restoring Quality of Life

Zimmer Biomet Dental Implants

Single-Tooth Replacement

Dental implants are used to replace missing teeth that have fallen out or have been extracted.

The implant is traditionally left to heal in the jawbone for a period of a few weeks to a few months, allowing the bone to be firmly fixed to the implant.

Once stable, a metallic post known as an abutment, is used to screw the restoration onto the implant.

Once complete, a restored implant looks and functions like a real tooth.

To find out if implants are a solution for you, ask your doctor to evaluate you today.
